

Instructions: Car Tracker

Before using the tracker for the first time it needs to be charged for at least 10 hours. Please make sure that there is credit on this number to enable the tracker to text back.

The swipe card provided is pre-registered with the tracker sim and can be used to put credit on the sim card. There is already a small amount of credit on the unit. To activate the unit depress the on button marked in white for 6-7 seconds. To confirm the unit is switched on telephone the number allocated to the unit, you should hear the ring tone. To switch the unit off again depress the white button again for 6-7 seconds.

When the unit is to be used once switched on leave it somewhere in the open for 5-10 minutes to enable it to get an initial GPS fix.

When positioning on the vehicle try to locate it as near to the edge as possible as this enables better satellite reception. It is wise if fitting to the underside of a vehicle to try and locate it in a position that it is not liable to be hit by stone chips, etc, thrown up of the road.

Although we have made great efforts to make this unit waterproof if used in wet conditions it is essential to enclose the whole unit in a sealed bag (supplied) to ensure total waterproofing. This will not affect the magnets.

To obtain a position report from the tracker, simply send a blank text from any mobile phone to the tracker. If a fix is obtained the tracker will text you back with a position report which will show date, time, co-ordinates and either GPS fixed or GPS not fixed. If it says not fixed this means that it has been unable to accurately find its position and the data has been taken from the last known position.

An example report is shown below, the numbers highlighted are the GPS co-ordinates and if these are entered into the search box on Google maps <http://maps.google.co.uk/> this will show the exact position of the tracker.

Please note the time is set to GMT.

Position Report:

Eyetek Tracker
